Information on performance of analysis and a more detailed

annotation of this entry and other sequences of chromosomes 3, 4

and 5 can be viewed at: http://www.mips.biochem.mpg.de/proj/thal/

this fragment has an overlap with ATCHRIV7 at the 5' end and an

overlap with ATCHRIV9 at the 3' end.

(http://expasy.hcuge.ch/sprot/prosite.html) and Pfam (http://pfam.wastl.edu/) libraries. A description of these categories can be found at the found at the found at the found at the found at the found at the found at the found at the found at the found at the found at the function of each repeat as either transposon, putative microsatellite, LINE, direct repeat, centromeric repeat, etc.
                                                                                                                                                                                                                                                                                      If you have any questions or confirmatory or contradictory evidence concerning the annotation of F9H3, please direct email to Larry Darnell at parnell@cshl.org.

BAC F9H3 was sequenced as part of the arabidopsis genome sequencing effort of the Cold Spring Harbor Consortium. For additional information, please see http://www.cshl.org/arabweb. Fingerprint data indicate F9H3 overlaps with F4C21 toward the telomere and with T5L23 toward the centromere. F9H3 contains marker mi233 at 18.8 cM on the Lister & Dean RI map.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /translation="MEDPLIGRDSLGGGGTDRVRRSBAITHGTPFQKAAALVDLAEDG

Arabidopsis thalian BAC F9H3 from chromosome IV near 18.8 cM
RAC F9H3 is assigned between YACS CIC4A7 and CIC6B1 and maps to
near 18.8 cM on the Lister & Dean RI map. Position 105 F9H3 is
oriented toward the centromere and position 95519 is oriented
toward the telomere. For more information on the mapping,
sequencing and annotation of F9H3. please see
http://www.csh1.org/arabweb/F9H3-titlepage.html. A graphic view of
our annotation is also available at this url. Gene models are built
with exons preddicted by GenScan
(http://cCR-081.mit.edu/GENSCAN.html), MZEF
(http://cCR-081.mit.edu/GENSCAN.html), MZEF
(http://compio.orml.gov/tools/index.shtml) and with splice sites
predicted by NetPlantGene
(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html). Alternate exons
not used in building the gene models are presented on the scheme
BAC.gene number. Typically, these numbered according to the scheme
BAC.gene number. Typically, these numbered seconding to the scheme
some moves from position 1 of the BAC. Protein sequences ecoded
by the genes are assigned to a functional category with the aid of
similarity searches and comparison to the Prosite

Coding seqences below are the result of integration and manual review of the following data: computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE INDEX.html) and The C. elegans of Repense cloning project (http://worfdb.dfci.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent* what Alignment program (Genome Research 10:115-1125, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans GenBank submissions, are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Mull. Acids. Res., 25, 955-964).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /codon_start=1

```

```
.v..v.: uns sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one m13 subclone.

## NEIGHBORING CLONE INFORMATION

The 5' clone is ZC178, 200 bp overlap; the 3' clone is B0507, 200 bp overlap. Actual start of this clone is at base position 1 of ZC196; actual end is at 3481 of B0507.

## NOTES:

Coding seqences below are the result of integration and manual review of the following data: computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE\_INDEX.html) and The C. elegans ORFeome cloning project (http://worfdb.ddci.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1115-1122, 2000), individual C. elegans Genbank submissions, and personal communications with C. elegans Genbank submissions, and personal communications with C. elegans researchers. tRNAs are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Mull. Acids. Res., 25, 955-964).

Submitted (19-APR-2003) Lita Annenberg Hazen Genome Center, Cold Spring Harbor Laboratories, 1, Bungtown Road, Cold Spring Harbor, 1, 11724, USA
ON Abr 19, 2003 this sequence version replaced gi:10944443.
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality as compressions and repeats; all regions were covered by at least one plasmid subclome or more than one M13 subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2541. .2622

Computational Analysis of Full-Length Mouse cDNAs Compared with

Human Genome Sequences Mamw. Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to

prepare full-length cDNA libraries for rapid discovery of new

genes. Genome Res. 10 (10, 1, 1617-1630 (2000)

RIKEN integrated sequence analysis (RIGA) system--384-format

sequencing pipeline with 384 multicapillary sequencer. Genome Res.

10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA

encyclopedia. real-time sequence clustering for construction of a

nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001)

cDNA library was prepared and sequenced in Mouse Genome

Computational Analysis of Full-Length Mouse cDNAs Compared with Human Genome Sequences Mamm. Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-171 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in Riken Division of Experimental Animal Research in Riken contributed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         / Jessue_type="brain"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 4768;
US-00-816-790-1

Sequence 1, Application US/09816790

Patent No. US200202255A1

GENERAL INFORMATION:

APPLICANT: Alien, Keith D.

APPLICANT: Phillips, Russell

TITLE OF INVENTION: TRANSCRENCE GENE DISRUPTIONS

FILE REFERENCE: R-855

CURRENT PLING DATE: 2001-03-22

PRIOR FILING DATE: 2000-03-22

PRIOR FILING DATE: 2000-03-15

PRIOR FILING DATE: 2000-03-15

SPRIOR FILING DATE: 2000-08-15

SPRIOR FILING DATE: 2000-08-15

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 1.

LENGTH 4768

Sequence 21, Application US/09479123

Patent No. 6670185

GENERAL INFORMATION:
APPLICANT: HARRINGTON, JOHN J.
APPLICANT: SHERE, BRUCE
APPLICANT: RINDET, STEPHEN
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR NON-TARGETED ACTIVATION OF
TITLE OF INVENTION: ENDOGENOUS GENES
TITLE OF INVENTION: ENDOGENOUS GENES
TITLE OF INVENTION: ENDOGENOUS GENES
TITLE OF INVENTION: ENDOGENOUS GENES
TITLE OF INVENTION: ENDOGENOUS GENES
TITLE OF INVENTION: 00038
CURRENT APPLICATION NUMBER: 09/283,814
PRIOR FILING DATE: 1999-03-08
PRIOR FILING DATE: 1999-02-19
PRIOR FILING DATE: 1999-02-19
PRIOR FILING DATE: 1998-09-24
PRIOR FILING DATE: 1998-09-24
PRIOR FILING DATE: 1998-09-24
PRIOR FILING DATE: 1997-09-26
NUMBER OF SEQ ID NOS: 33
SOFTWARE: PATENTIN VUMBER: 09/1203

Patent No. 594234

GENERAL INFORMATION:
APPLICANT: Ratcliffe, Peter John
APPLICANT: Firth, John David
APPLICANT: Pugh, Christopher William
APPLICANT: Stratford, Ian James
TITLE OF INVENTION: Targeting Gene Therapy
FILE REFERENCE: 08/693174

CURRENT APPLICATION NUMBER: US/08/693,174A

CURRENT FILING DATE: 1996-12-12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2725 CrccegeccrrrceAccaec 2744

The invention relates to a novel nucleic acid for a virus vector with silencer-blocking insulator activity that integrates into the genome of a mammalian stem cell comprising an insulator element a viral regulatory control element, and a coding nucleic acid molecule operatively associated with the viral regulatory element and capable of expression in the cell. The insulator element comprises a gypsy sequence, a cH84 dimer comprises an infectious retrovirus vector sequence or all or part of a fully defined sequence or a lentivirus vector sequence. The infectious retrovirus sequence comprises in the coding nucleic acid molecule is a reporter gene, where the reporter gene is PGK edfPP. The host cell is a stem cell of embryonic or adult tissue origin. The nucleic acid of the invention has antianaemic, antisickling, cytostatic, antiparkinsonian, nootropic, and neuroleic acid is useful for stem cell marking or stem cell genetic manipulation studies. The nucleic acid or vectors and compositions comprising if are also useful in stem cell marking or stem cell genetic comprising if are also useful in stem cell marking or stem of for treating patients with diseases, disorders or abnormal physical states of stem cells, e.g. thalassaemia, sickle cell anaemia, leukaemia, malignancies, or internoded and proper cells, e.g. thalassaemia, sickle cell anaemia, leukaemia, malignancies, or multiple collent and the collent control or malignancies or an unitial and compositions or multiple collents with a prefer cell anaemia, headed the collents and compositions or multiple collents with a prefer cell anaemia, leukaemia, malignancies, or meurodegenerative diseases such as parkinson's disease, and a collent cell anaemia, headed cells, e.g. thalassaemia, sickle cell anaemia, leukaemia, and cells, e.g. thalassaemia, sickle cell anaemia, cellente with cellente and compositions or an entored cellente and cellente and conjuditions and conjuditions and conjuditions and cellente and cellente and cellente and cellente and cellente and cellent

The invention relates to nucleotide construct for generating DNA constructs. The nucleotide construct comprises a sequence encoding a positive selection marker flanked by restriction enzyme sites, where restriction site is flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct can be treated so that single-stranded regions are created at each sequence lacking at least one nucleotide. The nucleotide construct is useful in a rapid and efficient method for generating DNA constructs suitable for introduction into embryonic stem cells and for disrupting the function of a gene in a cell. The present sequence is plasmid pGG4 vector construct containing an ampicillin resistance gene, a neomycin gene (Neo') and a green fluorescent protein (GFP) gene. On each site of the Neo' gene are two sites for ligation independent cloning along with restriction sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27 CCCGGCATTCTCGCAAGCTTCAAAAGCGCACGTCTGCCGCGCTATTGTGAGCGCTCACAA 86

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel isolated polymucleotide comprising a dendritic cell (DC)-expressed S-adenosyl homocysteine hydrolase (AHCY)-like molecule (DCL) gene. The polymicleotide of the invention demonstrates antiallergic and immunosuppressive activities and may be useful for treating a condition including an allergy such as asthma, allergic rhinitis or systemic anaphylaxis, an autoimmune disease such as diabetes mellitus or rheumatoid arthritis or transplant rejection. Purthermore, the polymicleotide may be useful as a vaccine or during gene therapy procedures. The genetically modified animal or the identified modulatory agent of the invention may be used in the study of immunity, DC function, brain physiology or neuronal cell function. The current sequence is that of the mouse DCAL knockout targeting vector DNA of the
dendritic cell expressed S-adenosyl homocysteine hydrolase-like molecule, DC, AHCY, DCAL, antiallergic; immunosuppressive, allergy, asthma; allergic rhinitis; systemic anaphylaxis; autoimmune; diabetes mellitus; rheumatoid arthritis; transplant rejection; vaccine; gene therapy; knockout targeting vector; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New dendritic cell expressed S-adenosyl homocysteine hydrolase-like molecule (DCAL) gene, useful for preparing a composition for treating or preventing a condition e.g., allergy, autoimmune disease or transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to a new nucleotide construct comprising a sequence encoding positive selection marker flanked by sequences which are sites. The restriction enzyme sites. The restriction enzyme sites. The relation enzyme sites are flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct is treated so that single-stranded regions are created at each sequences lacking at least one carget sequence or gene in a cell e.g. embryonic stem cell, by inserting sequences homologous to the target gene into the construct such that the sequences homologous to the target gene into the construct such that the captured into the cell to produce a homologous recombinant and thus the function of the target gene into the construct such that the construct into the cell to produce a homologous recombinant and thus the function of the target gene is disrupted. The homologous construct into the cell to produce a homologous recombinant and thus the be disrupted. The invention eliminates the site in the target gene that is to be disrupted. The invention eliminates the need for the traditional solation of a single genomic clone, restriction mapping of the clone and multiple cloning steps. The method of the invention mapping of the clone and multiple shows the method of the invention mapping of clone or mapping the restriction sites within the clone is not needed for the method. The method is ligation independent cloning the present the method is not needed for the method is ligation independent cloning the produce.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nucleic acid sequence represents the PDG4 plasmid vector sequence of the
Novel nucleotide construct useful for disrupting function of gene in embryonic stem cell, comprises sequence encoding positive selection marker flanked by restriction enzyme sites, to create a single-stranded

```
The invention relates to a targeting construct comprising two sequences homologous to a target gene, and a selectable marker, is new. The target homologous to a target gene, and a selectable marker, is new. The target gene is a retinal-specific muclear receptor gene, a lymphoid-specific GPCR (G protein coupled receptor) gene, a medianocyte stimulating homome compensation gene, a cGMP phosphodiesterase gene, chemokine creceptor Jense gene. Also included are transgenic mice comprising a sulfortansferase gene. Also included are transgenic mice comprising a disruption in a target gene, where the mouse exhibits an eye abnormality, cellular infiltration, hypoactive behaviour, lung abnormality, elevated white blood cell count, abnormality in the aorta, kidney, liver, lymph cellular infiltration, hypoactive behaviour, lung abnormality, or elevated levels of AlT (not defined), phosphorus, potassium, or cellular infiltration, aggressive, hyperactive, increased activity or decreased mutations into embryonic cells. The animal and cell-based systems may be mainety behaviour. The construct is used for introducing targeted customedical or behavioural phenotypes relating to a disruption in a transpet gene (e.g. tumours, cancer, retinal adgeneration and retinitis transpet gene (e.g. tumours, cancer, retinal degeneration and retinitis planentosa) and in screening or identifying compounds capable of the podd used to generate the gene targetting construct of the invention. C pDG4 used to generate the gene targetting construct of the invention.

C marker protein GPP (green fluorescent protein)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New targeting construct comprising a first and a second polynucleotide homologous to a target gene, and a selectable marker, useful for introducing targeted mutations into embryonic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 6355 BP; 1535 A; 1668 C; 1657 G; 1495 T; 0 U; 0 Other;

```
The present sequence for plasmid vector pDG4 is used as a construct for genes encoding trinucleotide repeat proteins (TRP) such as gene T243 to produce disruption in the DNA. The invention describes methods of producing embryonic stem (ES) cells comprising a heterozygous disruption in a target DNA sequence (preferably T243) encoding a TRP and of producing a knockout mouse comprising a hemozygous disruption in a defecting a phenotype of a knockout mouse. Also described are methods of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the coding TRP produces a phenotypic change. The transgenic animals and the encoding TRP produces a phenotypic change. The transgenic animals and the calsease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in the Huntington's disease. The animal models for trinucleotide repeat disorders e.g. fragile X syndrome and Huntington's disease. The animal models for trinucleotide repeat in city, the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both the pathogenic mechanism and the trinucleotide repeat instability in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence represents vector pDG4. This vector contains an ampicillin resistance gene, a neomycin gene and a green fluorescent protein (GFP) gene. The vector is used in the invention. The vector is used in the invention. The vector is used in the invention of the invention comprising a homozygous or heterozygous clisruption in MMP23 gene user useful for identifying agents which modulate disruption in MMP23 gene user useful for identifying agents which invention comprising a homozygous or heterozygous comprising a disruption in an MMP-23 gene or ameliorating a disruption in an MMP-23 gene or ameliorating a disraption in the MMP-23 gene or ameliorating a disraption in the MMP-23 gene. The animals are useful as an animal model disraption in the MMP-23 gene. The animals are useful as an animal model disrapses, disorders and conditions characterized by a disruption in gene encoding a metalloproteinase, more particularly disease, disorders and conditions characterized by the knockout mice. The transgenic animals are useful as test substrates for identification of drugs, pharmaceuticals and therapies effective in the target gene. The animals are useful as test substrates for identification of drugs, pharmaceuticals and therapies effective in the target gene. The animal is useful for testing and developing new the target gene. The animal is useful for testing and developing new the target gene. The animal is useful for testing and developing new the target gene. The animal phenotypes demonstrated by the animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4625 cecesearrerescarescriteaaagescarererescecescriterererererererar 4684

The invention relates to mucleotide construct for generating DNA constructs. The nucleotide construct comprises a sequence encoding a positive selection marker flanked by restriction enzyme sites, where restriction site is flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct can be treated so that single-stranded regions are created at each sequence lacking at least one nucleotide. The nucleotide construct is useful in a rapid and efficient method for generating DNA constructs suitable for introduction into embryonic stem sequence is plasmid pDG2 vector construct containing an ampicillin resistance gene and neomycin gene (Neo'). On each site of the Neo' gene are two sites for ligation independent cloning along with restriction
                                                                                                                                                         Novel nuclectide construct for generating DNA constructs for introduinto embryonic stem cell, comprising a sequence encoding a positive selection marker flanked by restriction enzyme sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 4768 BP; 1124 A; 1218 C; 1269 G; 1157 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a targeting construct comprising two sequences homologous to a target gene, and a selectable marker, is new. The target gene is a rethia-specific nuclear receptor gene, a lymphoid-specific GPCR (G protein coupled receptor) gene, a melanocyte stimulating hormone receptor like protein gene; a magnesium-dependent protein phosphatase gene, chemokine receptor like protein gene, a cGMP phosphoiseterase gene, chemokine ceptor like protein gene, where the mouse exhibits an eye abnormality, cellular inflitation, hypoactive behaviour, lung abnormality, elevated white blood cell count, abnormality in the acrta, kidney, liver, lymph nodes, skin or salivary gland, increased body and organ weight, or belintubin, aggressive, hyperactive, increased activity or decreased anxiety behaviour. The construct is used for introducing targeted anxiety behaviour. The construct is used for introducing targeted enset sent into embryonic cells. The animal and cell-based systems may be used as models for diseases or conditions associated with physicilogical, histological or behavioural phenotypes relating to a disruption in a carge gene (e.g. tumours, cancer, rethinal degeneration and retinitis pigmentosa) and in screening or identifying compounds capable of aneliorating or treating diseases. The present sequence is the vector pbG2 used to generate the gene targetting construct of the invention
                                                                                                                                                                                                      New targeting construct comprising a first and a second polynucleotide homologous to a target gene, and a selectable marker, useful for introducing targeted mutations into embryonic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Seguence 4768 BP; 1124 A; 1218 C; 1269 G; 1157 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a new nucleotide construct comprising a sequence encoding positive selection marker flanked by restriction enzyme sites. The restriction enzyme sate and flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct is treated so that single-granded regions are created at each sequence lacking at least one nucleotide. The invention is useful for disrupting the function of a target sequence or gene in a cell e.g. embryonic stem cell, by inserting sequences homologous to the target gene finat the construct such that the sequences homologous to the target gene finat the positive selection marker, to produce a targeting construct, and introducing the targeting
                                                                                                                                                                                                                                                                                                       Nucleotide construct; positive selection marker; restriction enzyme site; embryonic stem cell; knock-out vector; genomic clone; mapping; PDG2; plasmid vector; ds.
disease, disorders and conditions associated with the phenotypes demonstrated by the knockout mice. The transgenic animals are useful as test substrates for identification of drugs, pharmaceuticals and therapies effective in treating diseases, disorders and conditions associated with disruption in the target gene. The animal is useful for testing and developing new treatments relating to behavioural phenotypes demonstrated by the animal models
                                                                                                                                                                                                                                                                   CCCGGCATTCTCGCAAGCTTCAAAAGCGCACGTCTGCCGCGCTATTGTGAGCGCTCACAA 86

construct into the cell to produce a homologous recombinant and thus the function of the target gene or sequence is disrupted. The homologous sequences are sequences flanking the site in the target gene that is to be disrupted. The invention eliminates the need for the traditional bybridisation isolation of a single genemic clone, restriction mapping of the clone and multiple cloning steps. The method of the invention is fast and efficiently generates nucleotide construct, and reduces the time required for making a knock-out vector. Isolating an individual genomic clone or mapping the restriction sites within the clone is not needed for the method is ligation independent cloning. The present
                                                                                                                                                                                                                                                                                                                                          86

ö
a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents a phosphoglycerate Kinase (PGX)-neomycin (neo) gene fragment found in the positive selection vector construct c3406
                                                                                                                                                                                                                                                 75

genes encoding trinucleotide repeat proteins (TRP) such as gene 1243 to produce disruption in the DNA. The invention describes methods of producing embryonic stem (BS) cells comprising a heterozygous disruption in a target DNA sequence (preferably T243) encoding a TRP and of producing a knockout mouse comprising a homozygous disruption in a gene encoding TRP, where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs,

The present sequence for plasmid vector pDG2 is used as a construct for genes encoding trinucleotion renear notation and

invention. The specification describes a non-human transgenic animal invention. The specification describes a non-human transgenic animal comprising a disruption in the matrix metalloproteinase (MMP)-23 gene. Transgenic animals of the invention comprising a homozygous or heterozygous disruption in MMP23 gene are useful for identifying agents which modulate MMP23 expression or function. They are also useful for identifying agents that are capable of ameliorating a phenotype of a transgenic animal comprising a disruption in an MMP-23 gene or animal comprising a disruption in an MMP-23 gene or animal comprising a disruption in the MMP-23 gene. The animals are useful as an animal model for diseases, discorders and conditions characterized by a disruption in a gene encoding a metalloproteinase, more particularly
pharmaceuticals, therapies and interventions which may be effective in tracting trinucleotide repeat discorders e.g. fragila & syndrome and Huntington's disease. The animal models for trinucleotide repeat discorders are ideal model systems to study the progression of disease in vivo, the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both the pathogenic mechanism and the trinucleotide repeat instability in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pDG2; transgenic animal; matrix metalloproteinase-23 gene; MMP-23 gene;

                                                                                                                                                                                                                                                                                                                                                             à
             into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents a partial phosphoglycerate kinase (PGK) promoter incorporated into the positive selection vector constructs described in the invention
                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a targeting vector (positive selection vector) (I capable of modifying a target gene. (I) comprises two sequences (SI and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (I) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. When the selecting the comprising disruption or modification of target gene enhances recovery of cells having targeting vector integrated via homologous recombination
                                                                                                                                                                                                                                                                                                         9

The invention describes a targeting vector (positive selection vector)

(I) capable of modifying a target gene. (I) comprises two sequences (S1 and S2) homologues to a portion or region of a target gene, a selectable marker cassette and a regulator. (I) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (I) for enriching cells making disruption or modification of target gene enhances recovery of cells having targeting vector integrated via homologous recombination into the genomes of the cells. (I) is capable of modifying target gene in
into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents an oligonucleotide used in the creation of the positive selection vectors for targetted gene modification
                                                                                                                                                                                                                                                                                                                                                                            90

Claim 9; Fig 6D; 43pp; English.

Novel targeting vector modifying target gene, has first and second sequences homologous to target gene portions, a selectable marker cassette and regulator, useful for producing animals with targeted gene modifications.

WPI; 2002-383132/41.

The invention describes a targeting vector (positive selection vector) (I) capable of modifying a target gene. (I) comprises two sequences (SI and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (I) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (I) for enriching cells containing the comprising disruption or modification of target gene enhances recovery of

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
